

TBI Therapy
Regenerative Therapy for Brain Injury

WAVI QEEG

Over the past century, electroencephalography (EEG) has drastically evolved from old-fashioned galvanometers and paper recordings to the advanced digital technologies we use today.

WAVi was founded to be the next level of innovation in EEG by making this technology both user-friendly and accessible. The portability of the WAVi device allows for scans to take place anywhere, moving away from the past cumbersome constraints of EEG to routine clinical, and unconventional settings, such as a school, doctor's office or athlete locker room.

WAVi aims to take brain scanning to the masses and shape the future of brain care through objective data. Machine learning techniques will help to improve our understanding of a variety of brain related issues, and eventually create patient archetypes to help improve and personalize brain care.
